2 K-theory of C^* -algebras

The higher index

Overview

- Idea: study singular (e.g. non-Hausdorff) topological spaces through noncommutative C^* -algebras "associated to them".
- To do this, generalise tools from algebraic topology to C^* -algebras.
- This works well for *K*-theory.

() < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < () < ()

I Topological K-theory

< □ > < □ > < □ > < □ > < □ >

Topological K-theory of compact spaces

Let X be a compact Hausdorff space.

Definition

The **topological** *K*-**theory** of *X* is the abelian group $K^0(X)$ generated by the isomorphism classes of complex vector bundles on *X*, with the relation

 $[E\oplus F]\sim [E]+[F].$

So

 $K^0(X) = \{[E] - [F]; E, F \rightarrow X \text{ complex vector bundles}\}.$

The K-theory of a point

If X = * is a point, then

$$\mathcal{K}^0(*) = \{ [\mathbb{C}^m] - [\mathbb{C}^n]; m, n \in \mathbb{Z}_{\geq 0} \} \cong \mathbb{Z}.$$

The Serre-Swan theorem

Theorem (Serre-Swan)

If $E \to X$ is a complex vector bundle over a compact Hausdorff space X, then there is a vector bundle $E' \to X$ such that for some n,

 $E \oplus E' \cong X \times \mathbb{C}^n$.

The Serre-Swan theorem

Theorem (Serre-Swan)

If $E \to X$ is a complex vector bundle over a compact Hausdorff space X, then there is a vector bundle $E' \to X$ such that for some n,

 $E \oplus E' \cong X \times \mathbb{C}^n$.

So $\Gamma(E)$ is a finitely generated projective C(X)-module:

$$\Gamma(E)\oplus\Gamma(E')=C(X)^n.$$

Conversely, every finitely generated projective C(X)-module is of this form. And for two vector bundles $E, F \rightarrow X$,

$$E \cong F \quad \Leftrightarrow \quad \Gamma(E) \cong \Gamma(F).$$

The Serre-Swan theorem

Theorem (Serre-Swan)

If $E \to X$ is a complex vector bundle over a compact Hausdorff space X, then there is a vector bundle $E' \to X$ such that for some n,

 $E \oplus E' \cong X \times \mathbb{C}^n$.

So $\Gamma(E)$ is a finitely generated projective C(X)-module:

$$\Gamma(E)\oplus\Gamma(E')=C(X)^n.$$

Conversely, every finitely generated projective C(X)-module is of this form. And for two vector bundles $E, F \rightarrow X$,

$$E \cong F \quad \Leftrightarrow \quad \Gamma(E) \cong \Gamma(F).$$

So

 $K^{0}(X) = \{[M] - [N]; M, N \text{ finitely generated projective } C(X)\text{-modules}\}.$

Projections

Let $E \to X$ be a complex vector bundle over a compact Hausdorff space X, and $E' \to X$ such that $E \oplus E' \cong X \times \mathbb{C}^n$. Let

$$p: X \to \operatorname{End}(X \times \mathbb{C}^n) = M_n(C(X))$$

be the orthogonal projection onto E, for a metric on $X \times \mathbb{C}^n$ such that $E \perp E'$.

A B A A B A

Projections

Let $E \to X$ be a complex vector bundle over a compact Hausdorff space X, and $E' \to X$ such that $E \oplus E' \cong X \times \mathbb{C}^n$. Let

$$p: X \to \operatorname{End}(X \times \mathbb{C}^n) = M_n(C(X))$$

be the orthogonal projection onto E, for a metric on $X \times \mathbb{C}^n$ such that $E \perp E'$. Then p is a **projection**: $p = p^2 = p^*$. And

•
$$E = \operatorname{im}(p)$$

•
$$\Gamma(E) = pC(X)^n = \{x \mapsto p(x)f(x); f \in C(X)^n\}.$$

Projections

Let $E \to X$ be a complex vector bundle over a compact Hausdorff space X, and $E' \to X$ such that $E \oplus E' \cong X \times \mathbb{C}^n$. Let

$$p: X \to \operatorname{End}(X \times \mathbb{C}^n) = M_n(C(X))$$

be the orthogonal projection onto E, for a metric on $X \times \mathbb{C}^n$ such that $E \perp E'$. Then p is a **projection**: $p = p^2 = p^*$. And

•
$$\Gamma(E) = pC(X)^n = \{x \mapsto p(x)f(x); f \in C(X)^n\}.$$

Conversely, if $p: X \to M_n(C(X))$ is a projection, then E = im(p) is a vector bundle over X. And $im(p) \cong im(q)$ if and only if p and q are homotopic through projections, possibly in a larger matrix algebra. So

$${\mathcal K}^0(X)=\{[p]-[q]; p,q\in M_n({\mathcal C}(X)) ext{ for some } n ext{ are projections}\}.$$

< □ > < □ > < □ > < □ > < □ > < □ >

Functoriality

Let X and Y be compact Hausdorff spaces, and $f: X \to Y$ continuous. Then f induces

$$f^* \colon K^0(Y) \to K^0(X)$$

by

- $f^*([E] [F]) = [f^*E] [f^*F]$ for vector bundles $E, F \to Y$
- $f^*([M] [N]) = [M \otimes_{C(Y)} C(X)] [N \otimes_{C(Y)} C(X)]$ for f.g.p. (right) C(Y)-modules M, N
- $f^*([p] [q]) = [f^*p] [f^*q]$ for projections $p, q \in M_n(C(Y))$, where

$$(f^*p)_{j,k}(x) = p_{j,k}(f(x)).$$

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Locally compact spaces

Now let X be a locally compact Hausdorff space. Then its one-point compactification X^+ is a compact Hausdorff space.

Definition

The **topological** *K***-theory** of *X* is the kernel $K^0(X)$ of the map

$$i^* \colon K^0(X^+) \to K^0(\infty) = \mathbb{Z}$$

induced by the inclusion $i: \infty \hookrightarrow X^+$ of the point at infinity.

Higher K-theory

Definition

Let X be a locally compact Hausdorff space. Then for $n \in \mathbb{Z}_{>0}$,

 $K^n(X) = K^0(X \times \mathbb{R}^n).$

・ 何 ト ・ ヨ ト ・ ヨ ト

Higher K-theory

Definition

Let X be a locally compact Hausdorff space. Then for $n \in \mathbb{Z}_{>0}$,

$$\mathcal{K}^n(X) = \mathcal{K}^0(X \times \mathbb{R}^n).$$

Theorem (Bott periodicity)

For all such X and n,

 $K^{n+2}(X)\cong K^0(X).$

Peter Hochs (RU)

K-theory of C^* -algebras

< □ > < □ > < □ > < □ > < □ >

K-theory of unital C^* -algebras Let A be a C^* -algebra with a unit. Let

$$M_{\infty}(A) = \varinjlim_n M_n(A),$$

where $M_n(A) \hookrightarrow M_{n+1}(A)$ by padding with zeroes.

▲ □ ▶ ▲ 三 ▶ ▲ 三

K-theory of unital C^* -algebras

Let A be a C^* -algebra with a unit. Let

$$M_{\infty}(A) = \varinjlim_n M_n(A),$$

where $M_n(A) \hookrightarrow M_{n+1}(A)$ by padding with zeroes.

Definition

The **even** *K*-**theory** of *A* is the abelian group $K_0(A)$ generated by homotopy classes of projections in $M_{\infty}(A)$, subject to the relation

 $[p \oplus q] \sim [p] \oplus [q].$

Example

If X is a compact Hausdorff space,

$$K_0(C(X)) = K^0(X).$$

In particular, $K_0(\mathbb{C}) = \mathbb{Z}$.

Functoriality

Let A, B be a C^* -algebras with a units. Let $\varphi \colon A \to B$ be a *-homomorphism. Then

$$\varphi_* \colon K_0(A) \to K_0(B)$$

is defined by

$$\varphi([p]-[q])=[\varphi_*p]-[\varphi_*q],$$

where

$$(\varphi_* p)_{j,k} = \varphi(p_{j,k}).$$

< □ > < 同 > < 回 > < 回 > < 回 >

Functoriality

Let A, B be a C^* -algebras with a units. Let $\varphi \colon A \to B$ be a *-homomorphism. Then

$$\varphi_* \colon K_0(A) \to K_0(B)$$

is defined by

$$\varphi([p]-[q])=[\varphi_*p]-[\varphi_*q],$$

where

$$(\varphi_* p)_{j,k} = \varphi(p_{j,k}).$$

Example

Let X and Y be compact Hausdorff spaces, and $f: X \to Y$ continuous. Then $f^*: C(Y) \to C(X)$ is a *-homomorphism, and $(f^*)_*$ is the map $f^*: K^0(Y) \to K^0(X)$ from earlier.

Note: contravariant vs. covariant functoriality.

Peter Hochs (RU)

K-theory of C^* -algebras

Non-unital C^* -algebras

Let A be a C^* -algebra, not necessarily with a unit. The **unitisation** of A is the C^* -algebra

$$A^+ = A \oplus \mathbb{C},$$

with multiplication

$$(a+z)(b+w) = ab + wa + zb + zw,$$

involution

$$(a+z)^* = a^* + \bar{z}$$

and norm

$$||a+z|| = ||a+z||_{\mathcal{B}(A)}.$$

Non-unital C^* -algebras

Let A be a C^* -algebra, not necessarily with a unit. The **unitisation** of A is the C^* -algebra

$$A^+ = A \oplus \mathbb{C},$$

with multiplication

$$(a+z)(b+w) = ab + wa + zb + zw,$$

involution

$$(a+z)^* = a^* + \bar{z}$$

and norm

$$||a+z|| = ||a+z||_{\mathcal{B}(A)}.$$

Example

If X is a locally compact Hausdorff space, then $C_0(X)^+ = C(X^+)$.

K-theory of C*-algebras

18 June 11 / 41

A D N A B N A B N A B N

K-theory of non-unital C^* -algebras

Let A be a C*-algebra. Let $\pi: A^+ \to \mathbb{C}$ be projection onto the factor \mathbb{C} .

Definition

The even K-theory of A is the kernel of the map

$$\pi_* \colon K_0(A^+) \to K_0(\mathbb{C}) = \mathbb{Z}.$$

Higher K-groups

Definition

For a C^* -algebra A and $n \in \mathbb{Z}_{\geq 0}$,

$$K_n(A) = K_0(A \otimes C_0(\mathbb{R}^n)).$$

< □ > < □ > < □ > < □ > < □ >

Higher K-groups

Definition

For a C^* -algebra A and $n \in \mathbb{Z}_{\geq 0}$,

$$K_n(A) = K_0(A \otimes C_0(\mathbb{R}^n)).$$

Theorem (Bott periodicity)

For all such A and n,

$$K_{n+2}(A)=K_n(A).$$

We sometimes write $K_*(A) := K_0(A) \oplus K_1(A)$.

< □ > < □ > < □ > < □ > < □ > < □ >

Stability and continuity

Theorem (Stability) If two C^* -algebras A and B are Morita equivalent, then for all n,

 $K_n(A) = K_n(B).$

In particular, $K_n(A \otimes \mathcal{K}) = K_n(A)$.

- 4 回 ト 4 ヨ ト 4 ヨ ト

Stability and continuity

Theorem (Stability)

If two C^* -algebras A and B are Morita equivalent, then for all n,

 $K_n(A) = K_n(B).$

In particular, $K_n(A \otimes \mathcal{K}) = K_n(A)$.

Theorem (Continuity)

If $(A_j)_{j=1}^\infty$ is a sequence of C*-algebras connected by *-homomorphisms $A_n \to A_{n+1}$, then

$$\varinjlim_j K_n(A_j) = K_n(\varinjlim_j A_j).$$

(人間) トイヨト イヨト ニヨ

Direct sums

For a sequence of C^* -algebras $(A_j)_{i=1}^{\infty}$, let

$$\|(a_1, a_2, \ldots, a_n, 0, \ldots)\| = \sup_j \|a_j\|_{A_j}.$$

 ∞

i=1

Lemma

We have

$$K_n\left(\bigoplus_{j=1}^{\infty}A_j\right)=\bigoplus_{j=1}^{\infty}K_n\left(A_j\right).$$

Proof.

This is elementary for finite direct sums. By continuity, this extends to infinite direct sums.

Peter Hochs (RU)

Homotopy invariance

Let A and B be two C^* -algebras.

Definition

Two *-homomorphisms $f, g: A \to B$ are **homotopic** if there is a path of *-homomorphisms $(f_t)_{t \in [0,1]}: A \to B$ such that $f_0 = f$, $f_1 = g$ and for all $a \in A$,

$$t\mapsto f_t(a)$$

is a continuous path in B.

Proposition

If $f, g: A \rightarrow B$ are homotopic, then they induce the same map

$$f_* = g_* \colon K_*(A) \to K_*(B).$$

▲ □ ▶ ▲ □ ▶ ▲ □ ▶

The six-term exact sequence

Theorem

Let A be a C^{*}-algebra, and $J \subset A$ a closed, *-closed, two-sided ideal. Then there is an exact sequence

$$\begin{array}{c} K_0(J) \longrightarrow K_0(A) \longrightarrow K_0(A/J) \\ & \delta \\ & & & \downarrow^{\delta} \\ K_1(A/J) \longleftarrow K_1(A) \longleftarrow K_1(J) \end{array}$$

Here we use Bott periodicity: $K_2(J) = K_0(J)$.

Examples

• For any locally compact Hausdorff space X,

$$\mathcal{K}_n(C_0(X)) = \mathcal{K}^n(X).$$

$$\mathcal{K}_n(C_0(\mathbb{R}^n)) = \mathbb{Z} \qquad \mathcal{K}_{n+1}(C_0(\mathbb{R}^n)) = 0$$

$$\mathcal{K}_0(C_0([0,\infty))) = \mathcal{K}_1(C_0([0,\infty))) = 0$$

$$\mathcal{K}_0(C_0(\mathbb{R}) \rtimes (\mathbb{Z}/2)) = \mathbb{Z} \qquad \mathcal{K}_1(C_0(\mathbb{R}) \rtimes (\mathbb{Z}/2)) = 0$$

< □ > < 同 >

More examples

• For any Hilbert space H,

1

$$K_0(\mathcal{K}(H)) = K_0(\mathbb{C}) = \mathbb{Z}$$
 $K_1(\mathcal{K}(H)) = K_1(\mathbb{C}) = 0.$

• For any infinite-dimensional, separable Hilbert space H,

$$K_0(\mathcal{B}(H)) = K_1(\mathcal{B}(H)) = 0.$$

• If K is a compact Lie group, then by Peter–Weyl,

$$\mathcal{K}_0(C^*(\mathcal{K})) = \mathcal{K}_0\left(\bigoplus_{V \in \hat{\mathcal{K}}} \operatorname{End}(V)\right)$$
$$= \bigoplus_{V \in \hat{\mathcal{K}}} \mathcal{K}_0\left(\operatorname{End}(V)\right) = \bigoplus_{V \in \hat{\mathcal{K}}} \mathbb{Z} = R(\mathcal{K}).$$

K_1 via invertible matrices

If A is a unital C*-algebra, let $GL_n(A)$ be the group of invertible $n \times n$ matrices over A. We embed $GL_n(A) \hookrightarrow GL_{n+1}(A)$ by adding a 1 on the bottom-right corner, and zeros everywhere else. Set

$$\operatorname{GL}_{\infty}(A) = \varinjlim_{n} \operatorname{GL}_{n}(A).$$

Let $GL_{\infty}(A)_0 < GL_{\infty}(A)$ be the connected component of the identity.

K_1 via invertible matrices

If A is a unital C*-algebra, let $GL_n(A)$ be the group of invertible $n \times n$ matrices over A. We embed $GL_n(A) \hookrightarrow GL_{n+1}(A)$ by adding a 1 on the bottom-right corner, and zeros everywhere else. Set

$$\operatorname{GL}_{\infty}(A) = \varinjlim_{n} \operatorname{GL}_{n}(A).$$

Let $GL_{\infty}(A)_0 < GL_{\infty}(A)$ be the connected component of the identity.

Proposition

For every, possibly non-unital, C^* -algebra A, there is an isomorphism of abelian groups

$$\operatorname{GL}_{\infty}(A^+)/\operatorname{GL}_{\infty}(A^+)_0\cong K_1(A).$$

(4) (日本)

III K-theory of C^* -algebras of reductive Lie groups

< 47 ▶

→ ∃ →

For a real reductive Lie group G, the group C^* -algebra $C^*_r(G)$ can be described explicitly via representation theory. (See Tyrone's lectures.) This can be used to describe $K_0(C^*_r(G))$, but it gives more information.

The reduced C^* -algebra of a real reductive group

Let G be a connected, linear, real reductive Lie group.

Theorem (A. Wassermann, Clare–Crisp–Higson, Clare–Higson–Song–Tang)

The reduced group C^* -algebra of G is Morita equivalent to

$$\sum_{[P,\sigma]} C_0(\mathfrak{a}/W'_{\sigma}) \rtimes R_{\sigma}.$$

- P = MAN runs over the cuspidal parabolics
- σ is a discrete series representation of M
- $[P, \sigma] = [P', \sigma']$ if there is a $k \in K$ such that $M'A' = kMAk^{-1}$ and $Ad_k^* \sigma' \cong \sigma$
- $W_{\sigma} = \{ w \in N_{K}(MA); Ad_{w}^{*} \sigma \cong \sigma \} / (K \cap M)$
- $I(w, \sigma)$: $\operatorname{Ind}_{P}^{G}(\sigma \otimes 1) \to \operatorname{Ind}_{P}^{G}(\operatorname{Ad}_{w}^{*} \sigma \otimes 1)$ is the Knapp–Stein intertwiner
- $W'_{\sigma} = \{ w \in W_{\sigma}; I(w, \sigma) \in \mathbb{C}I \}$
- $W_{\sigma} = W'_{\sigma} \rtimes R_{\sigma}$ for the *R*-group $R_{\sigma} \cong (\mathbb{Z}/2)^n_{\dot{\Box}}$

The K-theory $C_r^*(G)$: trivial contributions

Theorem

The reduced group C^* -algebra of G is Morita equivalent to

$$\sum_{[P,\sigma]} C_0(\mathfrak{a}/W'_{\sigma}) \rtimes R_{\sigma}.$$

▲ □ ▶ ▲ 三 ▶ ▲ 三

The K-theory $C_r^*(G)$: trivial contributions

Theorem

The reduced group C^* -algebra of G is Morita equivalent to

$$\sum_{[P,\sigma]} C_0(\mathfrak{a}/W'_{\sigma}) \rtimes R_{\sigma}.$$

Lemma

If $W'_{\sigma} \neq \{e\}$, then

$$K_*(C_0(\mathfrak{a}/W'_{\sigma}) \rtimes R_{\sigma}) = 0.$$

< □ > < □ > < □ > < □ > < □ > < □ >

The K-theory $C_r^*(G)$: trivial contributions

Theorem

The reduced group C^* -algebra of G is Morita equivalent to

$$\sum_{[P,\sigma]} C_0(\mathfrak{a}/W'_{\sigma}) \rtimes R_{\sigma}.$$

Lemma

If $W'_{\sigma} \neq \{e\}$, then

$$K_*(C_0(\mathfrak{a}/W'_{\sigma}) \rtimes R_{\sigma}) = 0.$$

Example

If dim(\mathfrak{a}) = 1 and $W_{\sigma} = W'_{\sigma}$ acts by reflections,

$$\mathcal{K}_*(\mathcal{C}_0(\mathfrak{a}/W'_\sigma)\rtimes R_\sigma)=\mathcal{K}_*(\mathcal{C}_0([0,\infty)))=0.$$

< □ > < 同 > < 回 > < 回 > < 回 >

The K-theory $C_r^*(G)$: nontrivial contributions

Theorem (Knapp-Stein)

If $W'_{\sigma} = \{e\}$, then $R_{\sigma} = (\mathbb{Z}/2)^{\dim(A_{\max}) - \dim(A)}$, and a is R_{σ} -equivariantly isomorphic to $\mathbb{R}^{\dim(A)}$, on which R_{σ} acts by reflections in the first $\dim(A_{\max}) - \dim(A)$ coordinates.

The K-theory $C_r^*(G)$: nontrivial contributions

Theorem (Knapp-Stein)

If $W'_{\sigma} = \{e\}$, then $R_{\sigma} = (\mathbb{Z}/2)^{\dim(A_{\max}) - \dim(A)}$, and a is R_{σ} -equivariantly isomorphic to $\mathbb{R}^{\dim(A)}$, on which R_{σ} acts by reflections in the first $\dim(A_{\max}) - \dim(A)$ coordinates.

Corollary

If $W'_{\sigma} = \{e\}$, then

 $C_0(\mathfrak{a}/W'_{\sigma}) \rtimes R_{\sigma} \cong C_0(\mathbb{R}^{\dim(A_{\max})}) \otimes (C_0(\mathbb{R}) \rtimes (\mathbb{Z}/2))^{\otimes (\dim(A_{\max}) - \dim(A))},$

and

$$egin{aligned} &\mathcal{K}_{\dim(\mathcal{A}_{\max})}ig(\mathcal{C}_0(\mathfrak{a}/W'_\sigma)
times \mathcal{R}_\sigmaig) = \mathbb{Z} \ &\mathcal{K}_{\dim(\mathcal{A}_{\max})+1}ig(\mathcal{C}_0(\mathfrak{a}/W'_\sigma)
times \mathcal{R}_\sigmaig) = 0. \end{aligned}$$

Note: $\dim(A_{\max}) = \dim(G/K) \mod 2$.

イロト イヨト イヨト

The *K*-theory of $C_r^*(G)$

Conclusion:

$$\begin{aligned} \mathcal{K}_{\dim(G/\mathcal{K})}(C_r^*(G)) &= \bigoplus_{[P,\sigma]} \mathcal{K}_{\dim(G/\mathcal{K})}(C_0(\mathfrak{a}/W'_{\sigma}) \rtimes R_{\sigma}) \\ &= \bigoplus_{[P,\sigma], W'_{\sigma} = \{e\}} \mathbb{Z} \end{aligned}$$

and

 $K_{\dim(G/K)+1}(C_r^*(G))=0.$

The discrete series

Suppose that G has a compact Cartan subgroup. Then it is a cuspidal parabolic of itself, and $C_r^*(G)$ has the direct summand

 $\bigoplus_{\sigma\in \hat{G}_{ds}}\mathcal{K}(H_{\sigma}).$

So $K_0(C_r^*(G))$ has the direct summand

$$igoplus_{\sigma\in \widehat{G}_{\mathsf{ds}}} \mathcal{K}_0(\mathcal{K}(\mathcal{H}_\sigma)) = igoplus_{\sigma\in \widehat{G}_{\mathsf{ds}}} \mathbb{Z}.$$

The discrete series

Suppose that G has a compact Cartan subgroup. Then it is a cuspidal parabolic of itself, and $C_r^*(G)$ has the direct summand

 $\bigoplus_{\sigma\in\hat{G}_{ds}}\mathcal{K}(H_{\sigma}).$

So $K_0(C_r^*(G))$ has the direct summand

$$igoplus_{\sigma\in \hat{G}_{\mathsf{ds}}} \mathcal{K}_0(\mathcal{K}(\mathcal{H}_\sigma)) = igoplus_{\sigma\in \hat{G}_{\mathsf{ds}}} \mathbb{Z}.$$

The generator corresponding to $\sigma \in \hat{G}_{ds}$ can be described as follows. Fix $v \in H_{\sigma}$ of norm 1. Consider the matrix coefficient

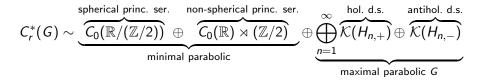

$$m_{v,v}(g) = (\sigma(g)v, v).$$

Then $p_{\sigma} := d_{\sigma} m_{v,v}$ is an idempotent in $C_r^*(G)$, and its class generates $\mathcal{K}_0(\mathcal{K}(\mathcal{H}_{\sigma}))$.

Peter Hochs (RU)

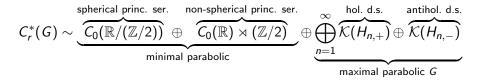

Example: $G = SL(2, \mathbb{R})$

If $G = SL(2, \mathbb{R})$, then we have a Morita equivalence

Example: $G = SL(2, \mathbb{R})$

If $G = SL(2, \mathbb{R})$, then we have a Morita equivalence

So

$$\mathcal{K}_0(\mathcal{C}_r^*(\mathcal{G})) = \mathcal{K}_0(\mathcal{C}_0(\mathbb{R}) \rtimes (\mathbb{Z}/2)) \oplus \bigoplus_{n=1}^{\infty} \mathcal{K}_0(\mathcal{K}(\mathcal{H}_{n,+})) \oplus \mathcal{K}_0(\mathcal{K}(\mathcal{H}_{n,-})),$$

where every K-group on the right hand side is \mathbb{Z} .

Example: complex groups

Let G be a complex semisimple Lie group. Then there is one parabolic P = MAN up to conjugacy, M is a torus, and all principal series representations are irreducible. So $W'_{\sigma} = W_{\sigma}$ for all $\sigma \in \hat{M}$, and there is a Morita equivalence

$$C^*_r(G) \sim \bigoplus_{[P,\sigma]} C_0(\mathfrak{a}/W_\sigma) = C_0(\hat{G}_{\mathsf{temp}}).$$

Example: complex groups

Let G be a complex semisimple Lie group. Then there is one parabolic P = MAN up to conjugacy, M is a torus, and all principal series representations are irreducible. So $W'_{\sigma} = W_{\sigma}$ for all $\sigma \in \hat{M}$, and there is a Morita equivalence

$$C^*_r(G) \sim igoplus_{[P,\sigma]} C_0(\mathfrak{a}/W_\sigma) = C_0(\hat{G}_{\mathsf{temp}}).$$

So

$$\mathcal{K}_n(\mathcal{C}^*_r(\mathcal{G})) = \mathcal{K}^n(\hat{\mathcal{G}}_{ ext{temp}}) = igoplus_{W_\sigma = \{e\}} \mathcal{K}^n(\mathfrak{a}),$$

and

$$\mathcal{K}^{\dim(G/\mathcal{K})}(\mathfrak{a}) = \mathbb{Z} \qquad \mathcal{K}^{\dim(G/\mathcal{K})+1}(\mathfrak{a}) = 0.$$

This case was worked out by Penington and Plymen in 1983.

IV The higher index

< □ > < □ > < □ > < □ > < □ >

The Fredholm index

Consider the ideal $\mathcal{K}(H) \subset \mathcal{B}(H)$. We have the boundary map in the six-term exact sequence

 $\delta \colon K_1(\mathcal{B}(H)/\mathcal{K}(H)) \to K_0(\mathcal{K}(H)) = \mathbb{Z}.$

< □ > < 同 > < 回 > < 回 > < 回 >

The Fredholm index

Consider the ideal $\mathcal{K}(H) \subset \mathcal{B}(H)$. We have the boundary map in the six-term exact sequence

$$\delta \colon \mathcal{K}_1(\mathcal{B}(H)/\mathcal{K}(H)) \to \mathcal{K}_0(\mathcal{K}(H)) = \mathbb{Z}.$$

Let $F \in \mathcal{B}(H)$ be Fredholm. Then its class in $\mathcal{B}(H)/\mathcal{K}(H)$ is invertible, and defines an element

$$[F] \in K_1(\mathcal{B}(H)/\mathcal{K}(H)).$$

Proposition

Now

$$\delta[F] = \operatorname{index}(F) = \dim(\ker(F)) - \dim(H/\operatorname{im}(F)).$$

▲ □ ▶ ▲ □ ▶ ▲ □ ▶

The abstract index

Whenever we have an ideal $J \subset A$ and an element $a \in A$ invertible modulo J, we can **define**

$$\operatorname{index}_J(a) := \delta[a] \in K_0(J),$$

where

$$\delta \colon K_1(A/J) \to K_0(J)$$

is the boundary map form the six-term exact sequence.

∃ ▶ ∢ ∃

The abstract index

Whenever we have an ideal $J \subset A$ and an element $a \in A$ invertible modulo J, we can **define**

$$\operatorname{index}_J(a) := \delta[a] \in K_0(J),$$

where

$$\delta \colon K_1(A/J) \to K_0(J)$$

is the boundary map form the six-term exact sequence.

In particular, if \mathcal{E} is a Hilbert A-module, then an A-Fredholm operator $F \in \mathcal{L}(\mathcal{E})$ has an index

$$\operatorname{index}_{\mathcal{K}(\mathcal{E})}(F) \in K_0(\mathcal{K}(\mathcal{E})).$$

If \mathcal{E} is **full**, i.e.

$$\mathsf{span}\{(v,w);v,w\in\mathcal{E}\}\subset A$$

is dense, then ${\mathcal E}$ defines a Morita equivalence between ${\mathcal K}({\mathcal E})$ and $A_{\!\!}$ and we obtain

$$\operatorname{index}_{\mathcal{K}(\mathcal{E})}(F) \in K_0(A).$$

Peter Hochs (RU)

(4) (3) (4) (4) (4)

The equivariant index

Let G be a locally compact group acting properly and isometrically on a Riemannian manifold M, such that M/G is compact. Let D be a G-equivariant elliptic, self-adjoint, odd-graded, first order differential operator on a $\mathbb{Z}/2$ -graded Hermitian G-vector bundle $E \to M$.

The equivariant index

Let G be a locally compact group acting properly and isometrically on a Riemannian manifold M, such that M/G is compact. Let D be a G-equivariant elliptic, self-adjoint, odd-graded, first order differential operator on a $\mathbb{Z}/2$ -graded Hermitian G-vector bundle $E \to M$.

We constructed a Hilbert $C^*(G)$ -module \mathcal{E} by completing $\Gamma_c(E)$ in the inner product

$$(s_1, s_2)(g) = (s_1, g \cdot s_2)_{L^2(E)}.$$

The operator D defines a $C^*(G)$ -Fredholm operator $F \in \mathcal{L}(\mathcal{E})$, which is a modification of

$$\frac{D}{\sqrt{D^2+1}}$$

Here $C^*(G)$ can be either the maximal or reduced group C^* -algebra.

Definition

The equivariant index of D is

$$\operatorname{ndex}_G(D) = \operatorname{index}_{\mathcal{K}(\mathcal{E})}(F) \in K_0(C^*(G)).$$

Relation with classical indices

If G = K is **compact**, then

 $\operatorname{index}_{\mathcal{K}}(D) = [\operatorname{ker}(D)] - [\operatorname{ker}(D^*)] \in \mathcal{K}_0(C^*(\mathcal{K})) = R(\mathcal{K}).$

(This is the Fredholm index if $K = \{e\}$.)

< □ > < 同 > < 回 > < 回 > < 回 >

Relation with classical indices

If G = K is **compact**, then

 $\operatorname{index}_{\mathcal{K}}(D) = [\operatorname{ker}(D)] - [\operatorname{ker}(D^*)] \in \mathcal{K}_0(\mathcal{C}^*(\mathcal{K})) = \mathcal{R}(\mathcal{K}).$

(This is the Fredholm index if $K = \{e\}$.)

Suppose that *M* is the universal cover of a compact manifold *X*, and that $G = \Gamma = \pi_1(X)$. Let D_X be the operator on $E/\Gamma \to X$ induced by *D*. Consider the homomorphism

$$\sum_{\Gamma} : C^*_{\max}(\Gamma) \to \mathbb{C}$$

given by summing functions over Γ .

< □ > < □ > < □ > < □ > < □ > < □ >

Relation with classical indices

If G = K is **compact**, then

 $\operatorname{index}_{\mathcal{K}}(D) = [\operatorname{ker}(D)] - [\operatorname{ker}(D^*)] \in \mathcal{K}_0(C^*(\mathcal{K})) = R(\mathcal{K}).$

(This is the Fredholm index if $K = \{e\}$.)

Suppose that *M* is the universal cover of a compact manifold *X*, and that $G = \Gamma = \pi_1(X)$. Let D_X be the operator on $E/\Gamma \to X$ induced by *D*. Consider the homomorphism

$$\sum_{\Gamma} : C^*_{\max}(\Gamma) \to \mathbb{C}$$

given by summing functions over Γ . Then

$$(\sum_{\Gamma})_* \operatorname{index}_{\Gamma}(D) = \operatorname{index}(D_X) \in \mathbb{Z}.$$

So $\operatorname{index}_{\Gamma}(D)$ is a **refinement** of $\operatorname{index}(D_X)$. (The same can be achieved via the trace $\tau(f) = f(e)$ on $C^*(\Gamma)$ via Atiyah's L^2 -index theorem.)

Dirac operators on G/K

Let G be a connected Lie group. Let K < G be maximal compact, and $\mathfrak{g} = \mathfrak{k} \oplus \mathfrak{p}$ an orthogonal decomposition for a K-invariant inner product. Suppose (for simplicity) that the map

Ad:
$$K \to SO(p)$$

lifts to

$$\widetilde{\mathsf{Ad}}$$
: $K \to \mathsf{Spin}(\mathfrak{p})$.

Then we view the standard representation S_p of Spin(p) as a representation of K.

Dirac operators on G/K

Let G be a connected Lie group. Let K < G be maximal compact, and $\mathfrak{g} = \mathfrak{k} \oplus \mathfrak{p}$ an orthogonal decomposition for a K-invariant inner product. Suppose (for simplicity) that the map

Ad:
$$K \to SO(p)$$

lifts to

$$\widetilde{\mathsf{Ad}}$$
: $K \to \mathsf{Spin}(\mathfrak{p})$.

Then we view the standard representation S_p of Spin(p) as a representation of K.

Let $\{X_1, \ldots, X_n\}$ be an orthonormal basis of \mathfrak{p} . For $V \in \hat{K}$, consider the Dirac operator

$$D_{G/K}^V = \sum_{j=1}^n L_{X_j} \otimes c(X_j) \otimes 1_V$$

on

$$(C^{\infty}(G)\otimes S_{\mathfrak{p}}\otimes V)^{K}$$

The discrete series

Theorem (Parthasarathy 1972, Atiyah–Schmid 1977)

Let G be a connected, real semisimple Lie group with rank(G) = rank(K). Let $V \in \hat{K}$, and let λ be its highest weight. Then

- if $\lambda + \rho_K$ is regular, then ker_{L²} $(D_{G/K}^V)$ is the discrete series representation of G with Harish–Chandra parameter $\lambda + \rho_K$
- if $\lambda + \rho_K$ is singular, then $\ker_{L^2}(D_{G/K}^V) = 0$.

Theorem (Connes-Moscovici 1982)

Let G be a connected, real semisimple Lie group with rank(G) > rank(K). Then for all $V \in \hat{K}$, $ker_{L^2}(D_{G/K}^V) = 0$.

The Connes–Kasparov conjecture

Using the equivariant index, we obtain information from $D_{G/K}^V$ for **any** G and V.

Definition

Dirac induction is the map

$$\operatorname{\mathsf{D-Ind}}^{\mathsf{G}}_{\mathsf{K}}\colon \mathsf{R}(\mathsf{K}) o \mathsf{K}_*(\mathsf{C}^*_r(\mathsf{G}))$$

given by $\text{D-Ind}_{K}^{G}[V] = \text{index}_{G}(D_{G/K}^{V}).$

The Connes–Kasparov conjecture

Using the equivariant index, we obtain information from $D_{G/K}^V$ for **any** G and V.

Definition

Dirac induction is the map

$$\mathsf{D} ext{-Ind}^{\mathsf{G}}_{\mathsf{K}}\colon \mathsf{R}(\mathsf{K}) o \mathsf{K}_*(\mathsf{C}^*_r(\mathsf{G}))$$

given by $\text{D-Ind}_{K}^{G}[V] = \text{index}_{G}(D_{G/K}^{V}).$

Conjecture (Connes-Kasparov)

For almost connected Lie groups G, Dirac induction is an isomorphism of abelian groups.

A B A A B A

Proofs of the Connes-Kasparov conjecture

Conjecture (Connes-Kasparov)

For almost connected Lie groups G, Dirac induction $V \mapsto \operatorname{index}_G(D_{G/K}^V)$ is an isomorphism of abelian groups $R(K) \cong K_*(C_r^*(G))$.

Proofs:

- for semisimple/reductive groups:
 - ▶ by computing C^{*}_r(G): A. Wassermann 1987 + recent work by Clare, Crisp, Higson, Song, Tang and Vogan
 - directly: V. Lafforgue 2002, Afgoustidis 2019
- in general: Chabert-Echterhoff-Nest 2003.

Example: the discrete series

Suppose that G has discrete series representations, and let π be a discrete series representation. We saw that π contributes a generator

$$[p_{\sigma}] := [d_{\sigma}m_{v,v}] \in K_0(\mathcal{K}(H_{\sigma})) \subset K_0(C_r^*(G)).$$

This generator equals

$$[p_{\sigma}] = \mathsf{D}\text{-}\mathsf{Ind}_{\mathcal{K}}^{\mathcal{G}}[V] = \mathsf{index}_{\mathcal{G}}(D_{\mathcal{G}/\mathcal{K}}^{V}),$$

with $D_{G/K}^V$ as in Parthasarathy's/Atiyah–Schmid's construction.

Classifying space for proper actions

Let G be a locally compact, Hausdorff, second countable group.

Definition

A classifying space for proper actions by G is a topological space $\underline{E}G$ with a proper action by G, such that for any proper G-space X,

- there is a *G*-equivariant continuous map $X \rightarrow \underline{E}G$
- any two such maps are G-equivariantly homotopic.

This exists and is unique up to G-equivariant homotopy equivalence.

Example

If G is a connected Lie group, we can take $\underline{E}G = G/K$ by Abels' theorem.

・ 何 ト ・ ヨ ト ・ ヨ ト

The Baum–Connes conjecture

Conjecture (Baum-Connes 1982)

The equivariant index defines an isomorphism of abelian groups

$$RK^G_*(\underline{E}G) \to K_*(C^*_r(G)),$$

where RK_*^G denotes representable equivariant K-homology.

Intuitively, $RK_*^G(\underline{E}G)$ consists of homotopy classes of abstract *G*-equivariant elliptic operators on proper *G*-spaces *X* such that X/G is compact.

The idea is that this is more computable than $K_*(C_r^*(G))$.

The Baum–Connes conjecture

Conjecture (Baum-Connes 1982)

The equivariant index defines an isomorphism of abelian groups

$$RK^G_*(\underline{E}G) \to K_*(C^*_r(G)),$$

where RK_*^G denotes representable equivariant K-homology.

Intuitively, $RK_*^G(\underline{E}G)$ consists of homotopy classes of abstract *G*-equivariant elliptic operators on proper *G*-spaces *X* such that X/G is compact.

The idea is that this is more computable than $K_*(C_r^*(G))$.

The conjecture has been proved for many classes of groups.

An important open case is non-cocompact lattices in Lie groups with real rank \geq 2, e.g. SL(3, \mathbb{Z}).

・ロト ・四ト ・ヨト ・ヨト

Special cases

• If G is a connected, real Lie group, then

$$RK_G^*(\underline{E}G) = K_G^*(G/K) = R(K)$$

via $[D^V_{G/K}] \leftrightarrow [V]$, and the Baum–Connes conjecture becomes the Connes–Kasparov conjecture.

• The Novikov conjecture in manifold topology (rational injectivity), where $G = \pi_1(X)$ as earlier.

Topics not covered—a non-exhaustive list

- KK-theory: KK(A, B), encodes relations/maps between $K_*(A)$ and $K_*(B)$
- extracting information from *K*-theory via pairing with cyclic cohomology or traces, e.g. orbital integrals

Thank you
